

TME-2- Reflection

In Tme2 was very interesting and it did take a lot of research as I was aware of these systems but not in depth. Now I have their good understanding. I saw that Apache and Microsoft IIS belongs to the Open and Closed systems. These servers are big and costly, we can find these in big organizations such as Deloitte uses Microsoft servers while SAP the world's largest software providers is using as Microsoft and so many more organization. I also learned that a webmaster should have a well rich knowledge of servers, their working and even their maintenance as well as little knowledge of developing depending on the industry. It is commonly seen that open and closed systems are used in multi organizations depending on the needs of the organization. There are huge number of hurdles while deciding which one to buy, interesting radio conversation it was with Tom and Harry. Both have passion and strong supporting points for open and closed systems. The conversation has a diverse ideas and experience. The main conclusion is that there is no correct answer that open is better or closed system is better but it all depends on the requirements. There are lots of question that can arise in the mind of users of Apache and Microsoft as they both have their pros and cons. The decision of having one server/system at your organization, you need to well aware of different concerns, technical features of your system and how it can help the organization. No organization can put their performance on stake or they will not compromise their performance as they have huge number of clients and other stakeholders that it will turn out to be nightmare if it happens. So it is the responsibility of the webmaster to excel in all fields, have good concrete knowledge of the subject matter and help the company to grow.
