

## TME1- Reflection

Reflection: I think this assignment was personally giving us information or teach us about the exact role of webmaster. It is both a combination of software side where we develop as well as the technicality of our field that is computing science where we handle little troubleshooting issues to complex problems. I also learned that webmaster has a good role to play in the performance of our website as well as the security of the website should never ever be compromised.

There can be different roles and learning opportunities in the industry. If we choose a new or a start up firm where they are worried about the development and the maintenance of the website. A webmaster would have to develop and stay updating with the latest styles and formats. They will also be responsible to maintain the servers and check the traffic on the site and make it smooth for the audience to use it, whereas if we choose to work with an organization which is big and had made its impact on the industry. A webmaster will be more working on meeting the clients, staying up with the updates with technology or tools. Keep the site updating where the security and the brand of the company is never compromised. There can be more complex problems working with a start up company than in a company which is organized and stable for years.

There can be problems which source code in a small company where there will be just one person to handle that. I mean it will put more pressure on one individual and whereas, In big organization there can be other problems maybe little problems like troubleshooting a computer to getting a server to work.

I think working in a small company is more work and responsibility whereas working in a large organization can be less hectic but problems can be different and maybe complex. So a webmaster role depends on what position and in what company are you working. It varies as per industry requirements.
